                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                               17;
                                                                                                                               The present sequence is that of a poly(ADP-ribose) polymerase (PARP) contg. a DNA-binding domain (DBD). It is encoded by AAT13732, from which a fragment comprising nucleotides 67-1220 (-29 to + 1127) encoding the DBD can be inserted into vectors which are used for gene therapy. Over-expression of the DBD inhibits the DNA repair function of PARP, so the vectors are useful for gene therapy or tumours, esp. in combination with conventional chemo- and/or radiotherapy.

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Pol) (ADP-Tibose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autolimune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

This is the human poly (ADP-ribose) polymerase protein (PARP) sequence.

PARP is a 116kD DNA-binding protein that binds tightly to single-strand double-strand breaks. The PARP protein and Escherichia coli UvrA and UVIB proteins (see AAY58041-Y58042) are used in a method for the detection and quantitation of DNA base damage. The method involves quantifying at least one modification of interest in a nucleic acid sequence through the used of capillary electrophoresis, laser induced fluorescente and a fluorescenty labeled polypeptide (e.g. fluorescenty labeled polypeptide (e.g. fluorescenty labeled anti-PARP antibody) that is specific for the modification. The new method is useful for quantifying nucleic acid modifications, especially a mutation (including deletions, insertions and substitutions), mismatch, DNA adduct, or strand break (single or double). The method is useful for identifying and detecting exposure to carcinogens, and in early risk assessment for cancer, and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ADP-ribose) polymerase; DNA excision repair; DNA damage; PARP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17;
                                                                                                                                                                                                                                                              The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, meuological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabeces. The present sequence is a PARP protein, the CANA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                356
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              410

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequence for human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 as polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation telomore length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete poly(adenosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for tumor-associated genetic defects). Tumor cells treated with tumor-associated genetic defects). Tumor cells treated with (A) show an increased tendency to die when treated with radiation or chemotherapeutic

New human polypeptide of the polyADPribose synthetase family for use in diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease

Claim 1; Page 21; 30pp; English.

computes, sbhPARS2 The invention also relates to fragments, variants and sequences with intention also relates to fragments, variants and sequences with at least 95% identity to the sbhPARS2 Computed or nucleotide sequence; expression systems and host cells computising an sbhPARS2 nucleotide acid sequence; the recombinant expression of sbhPARS2; and an antibody specific for sbhPARS2. sbhPARS2 proteins compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of sbhPARS2 are useful for identifying compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of sbhPARS2 are useful for treating human cardiac ischaemia, myocardial infarction, stroke), inflammation, autoimmune disease (e.g. diabetes, multiple sclerosis) and neurodegenerative diseases (e.g., Parkinson's disease and Alzheimer's disease). sbhPARS2 nucleic acids are useful as diseases and Alzheimer's conscious to produce antibodies of therepeutic use. sbhPARS2 cones; or isolate full-length sbhPARS2 cDNAS and sbhPARS2 protein is also useful as an immunogen to produce antibodies for therapeutic use. sbhPARS2 or entile in cells. Protein in cells. sequence represents a novel human poly(ADP-ribose)

This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD^+-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP2 protein used in the method of the invention.

controlled trauma or massive bleeding, especially apoplexy or party is chemia, trauma or massive bleeding, especially apoplexy or spinal-cranial trauma; or Alzheimer's disease, Huntington's disease or parkinson's disease, Treating or preventing ischemic damage after renal ischemic damage after candiac ischemia or during and after (specifically renal damage after renal ischemia or during and after kidney transplantation or heart damage after cardiac ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. petit mal and complex partial application attacks) or partial epileptic attacks (e.g. petit mal and and complex partial attacks), treating microinfarction (e.g. during and after heart valve replacement, aneuryam resectioning and heart transplantation), revascularization of critically constricted coronary arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. leg arteries), treating acute myocardial ischemia and damage during or after its mechanical or drug'induced lysis and treating tumors and clisease (e.g. rheumatoid arthitis), and diabetes mellitus. Although (I) inhibit pare (i.e. the known form designated PARRI), they especially considerively and strongly inhibit pare homologs, specifically the homolog pare pare (generally by a factor of more than 5).
                                                                                                                                                                                                                                                                                                                                                          This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly (ADP-ribose) polymerase (PARP; EC 2.4.2.30) activity. The products of the invention have nootropic, neuroprotective, cerebroprotective, antiparkinsonian, nephrotropic, cardiant, vasotropic, antioflammatory, antirheumatic, antibacterial, immunosuppressive, antinflammatory, antirheumatic, antiarthritic, antidiabetic. (I) are especially used for treating or preventing neurodegenerative disease or neuronal damage (specifically associated
                                                                                                                                                                                                                   Drugs for inhibiting PARP or especially homologous enzymes comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        164

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Comment: This protein is a chromatin-bound enzyme.
C; Comment: This enzyme catalyzes DNA-dependent post-translational modifications of va C; Superfamily: NAD+ ADP-ribosyltransferase
C; Superfamily: NAD+ ADP-ribosyltransferase; NAD; nucleus; pentosyltransferase; zinc

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A. Description: Higher plants possess two poly(ADP-ribose) polymerases.
A. Reference number: 214991
A. Accession: T0366
A. Status: preliminary; translated from GB/EMBL/DDBJ
A. Molecule type: mRNA
A. Residues: 1-653 CBABA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NAD+ ADP-ribosyltransferase (EC 2.4.2.30), nuclear - human NiAlternate names: poly (ADP-ribose) polymerase; poly (ADP) (Species: Homo sapiens (man) (Species: Homo sapiens (man) (C.) C; Accession: S26057
Biochem. Cell Biol. 67, 653-660, 1989
A; Title: Cloning of rodent cDNA encoding the poly(ADP-ribose) polymerase catalytic domain A; Reference number: I52331; MUID: 90027702
A; Molecule type: mRNA
                                                                                                                       Map position: 1
Superfamily: NAD+ ADP-ribosyltransferase
Keywords: DNA binding; glycosyltransferase; NAD; nucleus; pentosyltransferase; zinc
                                                                                                                                                                                                                                                                               17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 HEDYDCTLNQTNIGNNNNKFYIIQLLEEG--SRFFCWNRWGRVGEV-GOSKMNHFTCLED 117

SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor. COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN (BY
                                                                             SUBGUITT: HOMODIMER (Potential).
SUBCELULIAR LOCATION: Nuclear.
SINGCELLANGOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELE, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
THE TREMINAL ADBENOSINE MOIETY, BUILDING UP A POLYMER WITH AN
AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS 1 BRCT DOMAIN.

"pADPRT-2: a novel mammalian polymerizing(ADP-ribosyl)transferase gene related to truncated pADPRT homologues in plants and Caenorhabditis
                                                    SEEMS TO PLAY A ROLE IN THE RESPONSE TO DAM DAMAGE.

--- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-IIbosyl}(N)-acceptor -
nicotinamide + {ADP-D-IIbosyl}(N+1)-acceptor.

--- SUBCELLULAR LOCATION: Nuclear.

--- TISSUE SPECIFICITY: Widely expressed; the highest levels were in testis followed by ovary.

--- INDUCTION: By high levels of DNA-damaging agents.

--- INDUCTION: By high levels of DNA-damaging agents.

     CELLULAR PROCESSES SUCH AS DIFFERENTIATION OF WALLOS AFFORMAND THE RECOLL FOR THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-TIDOSY]}(N) -acceptor -
nicotinamide + {ADP-D-TIDOSY]}(N+1)-acceptor.
-!- COFACTOR: ZITC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!- COFACTOR: ZITC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!- SUBGRILLANDE (POTENTIAL).
-!- SUBGRILLANDE (POTENTIAL).
-!- SUBCELLANDEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOLETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
-!- SIMILARITY: BELONGS TO THE PARP FAMILY.
